

Presentation of Mini-project
for
Generic Programming and library development
2006

Presentation points:

- ▣▣▣▣➤ Assignment
- ▣▣▣▣➤ Data structure
- ▣▣▣▣➤ Smart pointers
- ▣▣▣▣➤ Complexity
- ▣▣▣▣➤ Possible Improvements and known bugs

Assignment:

- ▣▣▣▣➤ Data structure for meldable priority queue
- ▣▣▣▣➤ STL queue interface
- ▣▣▣▣➤ Additional functions (CPH STL)
 - ▣▣▣▣➤ Iterator
 - ▣▣▣▣➤ `increase()`, `meld()`, `delete()`
- ▣▣▣▣➤ Complexity (Element comparisons / operations performed)
- ▣▣▣▣➤ Performance

Data structure:

- ▣▣▣▣➤ Chosen structure: Binomial heap
 - ▣▣▣▣➤ Draw binomial heap
- ▣▣▣▣➤ Thoroughly documented
- ▣▣▣▣➤ Max-heap
- ▣▣▣▣➤ Interesting properties (Cormen et al.)
 - ▣▣▣▣➤ 3 pointers: Parent, sibling and child
 - ▣▣▣▣➤ Degree of binomial trees
- ▣▣▣▣➤ Show binomial heap slide

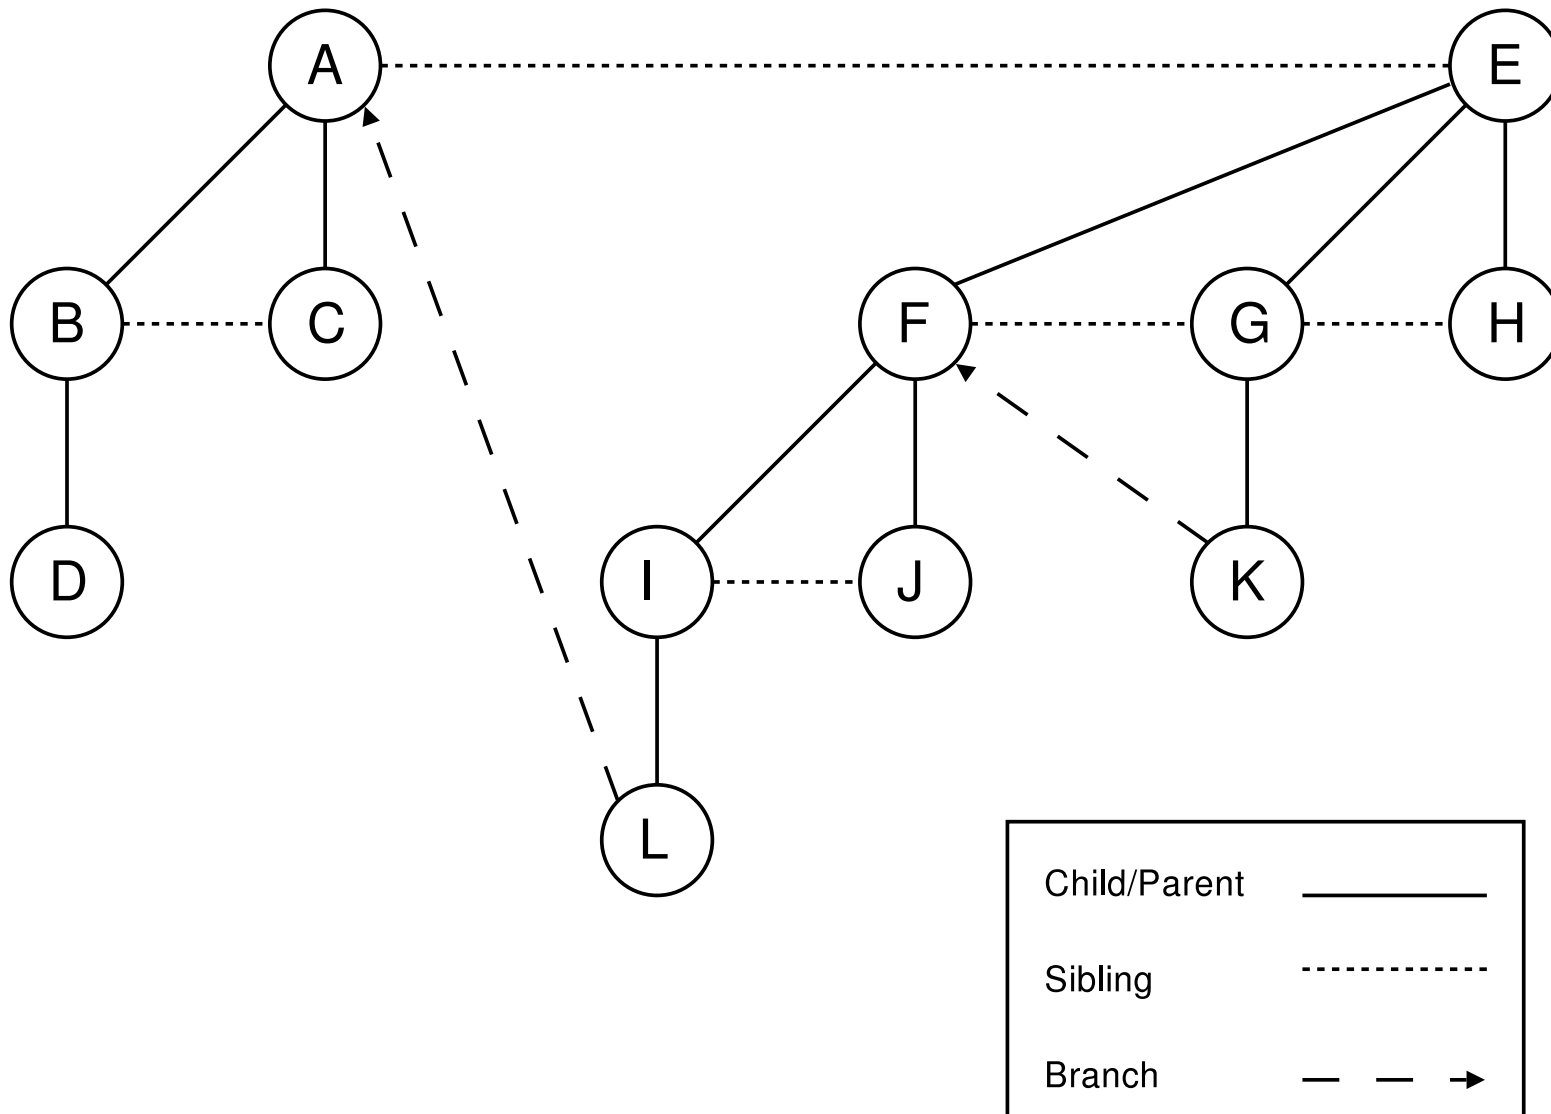

Figure 1: Binominal queue example.

Data structure cont.:

- ▣ Iteration
 - ▣ Post-order iteration
 - ▣ Constant time iteration Impossible with 3 pointers
 - ▣ Introduction of “previous branch”, “previous sibling”, “last child” and “leftmost left”
- ▣ Smart pointers
 - ▣ Shared pointers for structure necessary pointers
 - ▣ Weak for the rest (prevention of cyclic dependency)
 - ▣ Pro and con discussion later
- ▣ Show node structure slide

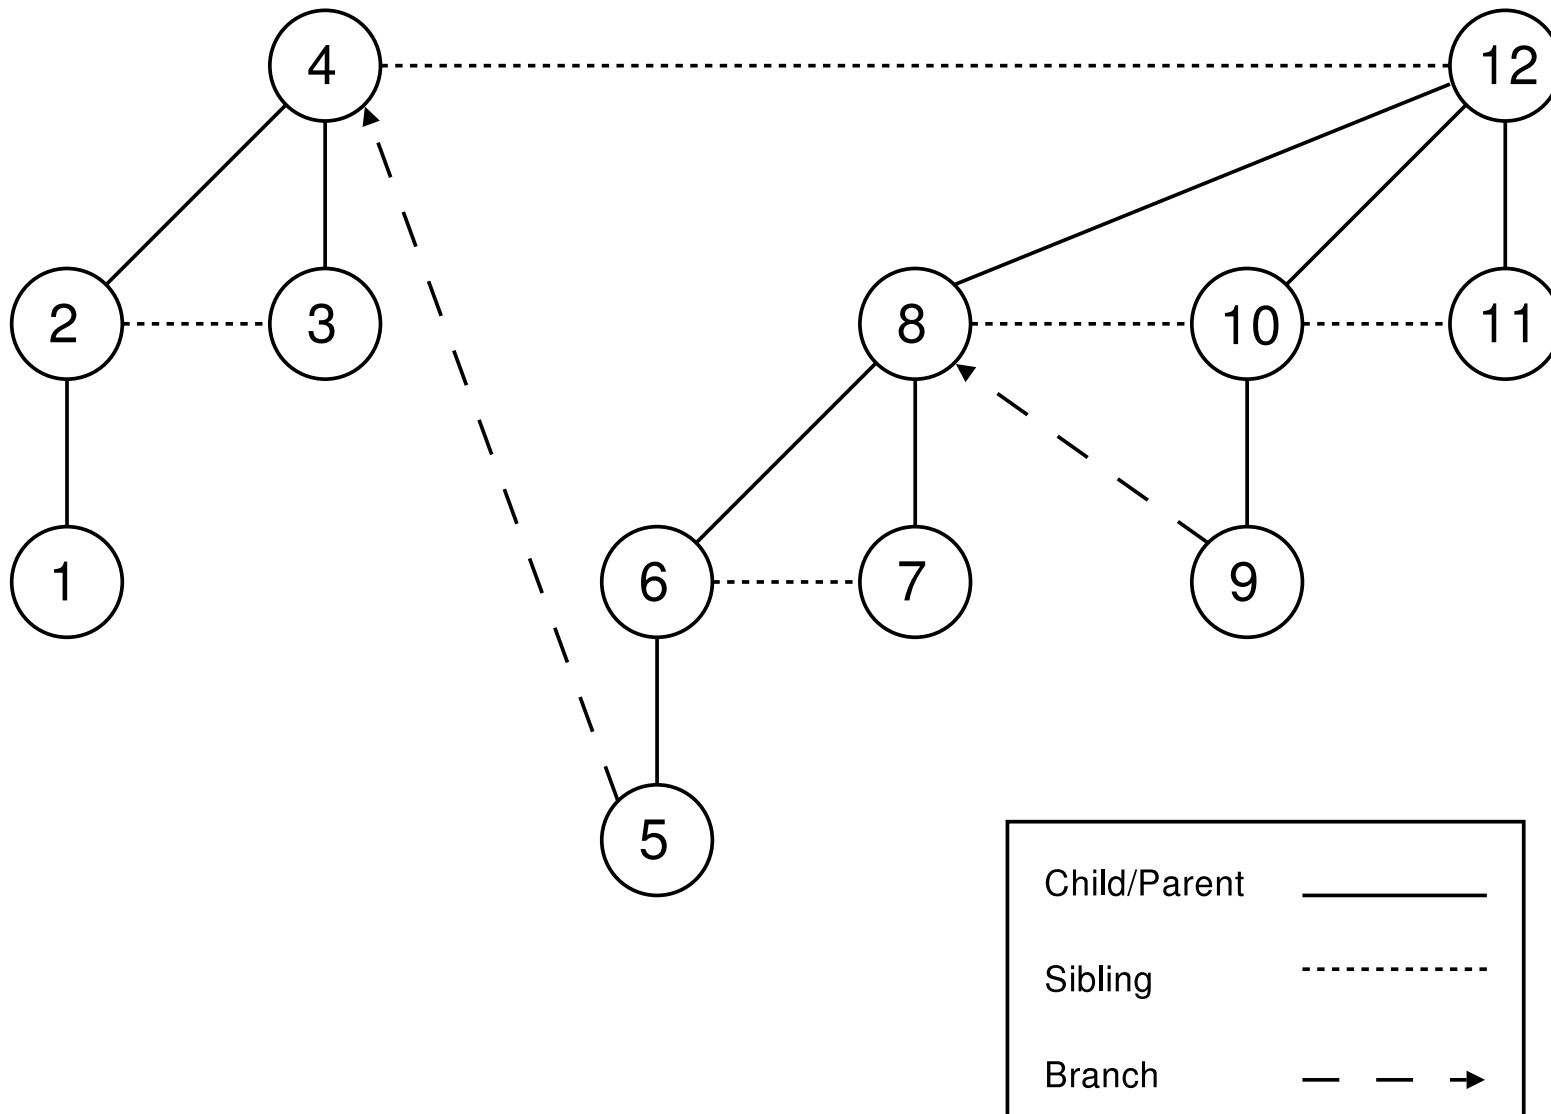

Figure 2: Binominal queue example numbered in post-order iteration.

Iteration rules:

▣▣▣▣➤ Forward iteration:

▣▣▣▣➤ If there is a next sibling, visit the left-most leaf of that sibling.

▣▣▣▣➤ Otherwise, visit the parent.

▣▣▣▣➤ Reverse iteration:

▣▣▣▣➤ Visit the last child.

▣▣▣▣➤ If there is no last child, visit the previous sibling.

▣▣▣▣➤ If there is no previous sibling, visit the branch.

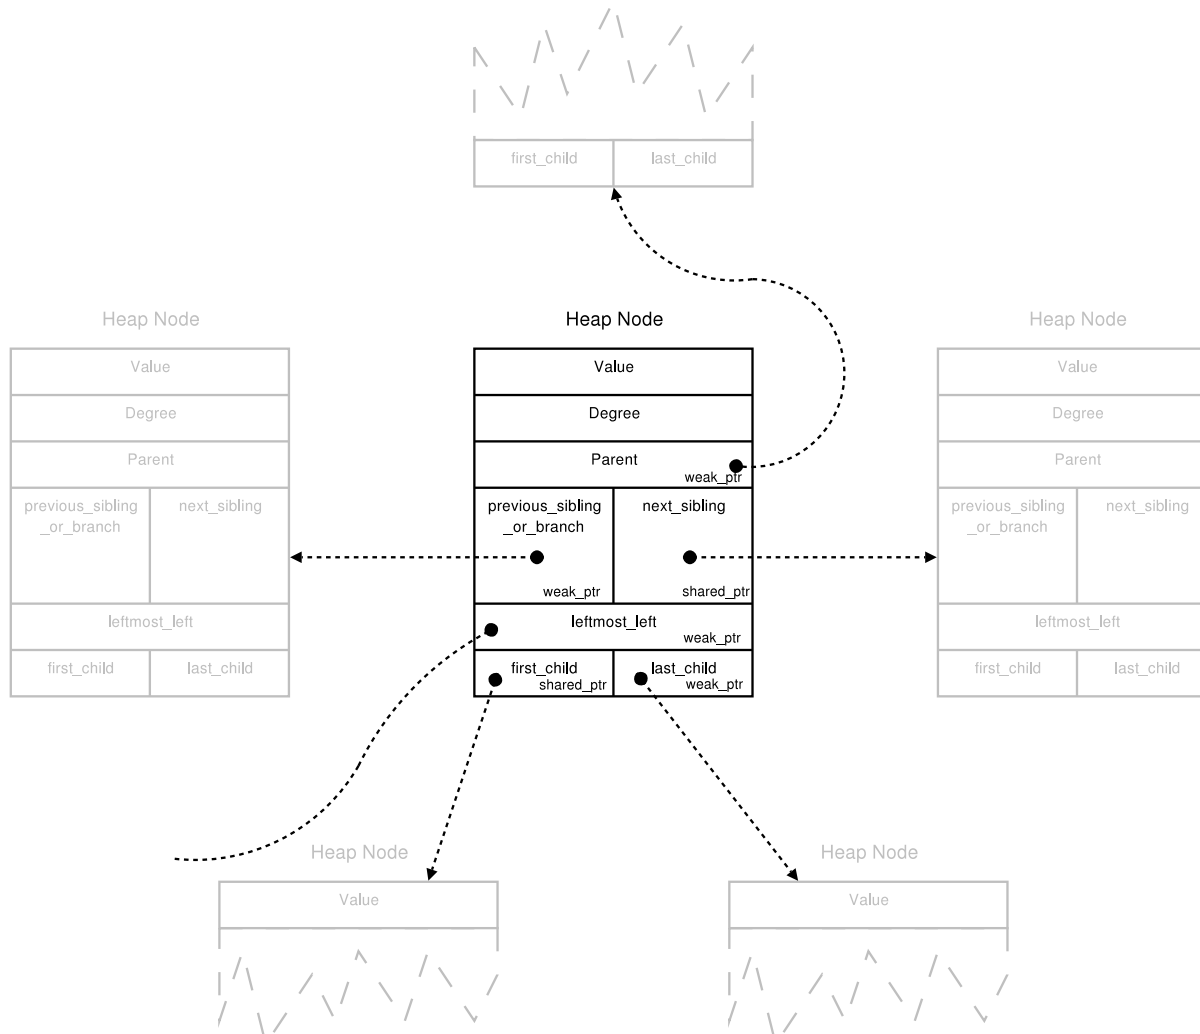

Figure 3: Visualization of heap node and some of its content.

Data structure cont.:

- ▣▣▣▣▶ Binomial heap implementation details
 - ▣▣▣▣▶ 2 sentinels: shared pointer to “head”, weak pointer “one past the end”.
 - ▣▣▣▣▶ Counter of nr. of elements
 - ▣▣▣▣▶ Pointer to maximum element
- ▣▣▣▣▶ Entire implementation is template based—STL standard
- ▣▣▣▣▶ Use for generic libraries

Smart pointers:

▣▣▣▣▶ Pro

- ▣▣▣▣▶ Weak pointer invalidation

- ▣▣▣▣▶ Automated Deletion

▣▣▣▣▶ Con

- ▣▣▣▣▶ Space Usage

- ▣▣▣▣▶ Performance overhead

- ▣▣▣▣▶ Complexity

 - ▣▣▣▣▶ Shared and weak

 - ▣▣▣▣▶ Accessing

 - ▣▣▣▣▶ `Constructor—shared_from_this`

- ▣▣▣▣▶ Debugging

Complexity:

- ▣ find-max() — 0 comparisons. $O(1)$
- ▣ insert() — $\log(n)$ comparisons. $O(\log(n))$
 - ▣ New node instantly inserted at front of heap
 - ▣ Worst case: each binomial tree will be re-linked
- ▣ delete() — $2 * \log(n)$ comparisons. $O((\log(n))^2)$?
 - ▣ Shifting up requires no element comparisons.
 - ▣ Melding will cost $\log(n)$ comparisons.
 - ▣ Finding a new max will cost $\log(n)$ comparisons.
- ▣ General constructor — $n * \log(n)$ comparisons. $O(n * \log(n))$
 - ▣ Iteration through given heap and insertion of each element.
 - ▣ Improved version exists to $2n$.
- ▣ Iterator functions — 0 comparisons. $O(1)$

Possible improvements and known bugs:

- ▣▣▣▣▶ Exceptions
- ▣▣▣▣▶ Normal pointers instead of “smart” pointers
- ▣▣▣▣▶ Improving general constructor complexity
 - ▣▣▣▣▶ Allowing two binomial trees of equal degree to exist
 - ▣▣▣▣▶ Balancing workload.
- ▣▣▣▣▶ Consolidate error
 - ▣▣▣▣▶ May invalidate top pointer. No longer points to root element.
 - ▣▣▣▣▶ One pointer check will solve this
 - ▣▣▣▣▶ line 275 ...and `(x != top_.lock())`
- ▣▣▣▣▶ More extensive unit test and a performance test
